External vs. Internal Halyards

When choosing a design for your flagpole project, the first consideration is the placement of the Halyard (rope or wire) used to raise and lower the flag.

An **External Halyard System** is the most common flagpole application and places Rope Halyard on the outside of the flagpole.

An **Internal Halyard System** encloses either Rope or Wire Halyard inside the flagpole behind the security of a lockable access door.
